FINAL YEAR PROJECT 2026

StallSeeker

SWE/134/24B

FOOD STALLSEEKER MOBILE APPS

Find nearby food stalls, live.

INTRODUCTION / PROJECT BRIEF

StallSeeker helps customers find nearby food stalls, check opening status and menu availability, and follow vendors for updates. Vendors manage stall details, menus, stock and shared location so customers can plan where and when to visit.

01 Problem Statement

- **Finding stalls:** Small and mobile vendors can be difficult to locate when their selling location changes.
- **Uncertain availability:** Customers may travel without knowing whether a stall is open or a dish is available.
- **Scattered updates:** Stall details and updates are often spread across separate channels.

02 Project Objectives

- **Locate:** Develop map-based discovery using GPS or a selected location, with relevant search filters.
- **Inform:** Provide vendor-managed opening status, menu prices, stock and location updates.
- **Connect:** Enable customers to follow stalls and dishes and receive relevant notifications.

03 Project Specification & Features

CUSTOMER DISCOVERY

Map and list views; dish, stall and category search; price, distance and opening-time filters.

VENDOR MANAGEMENT

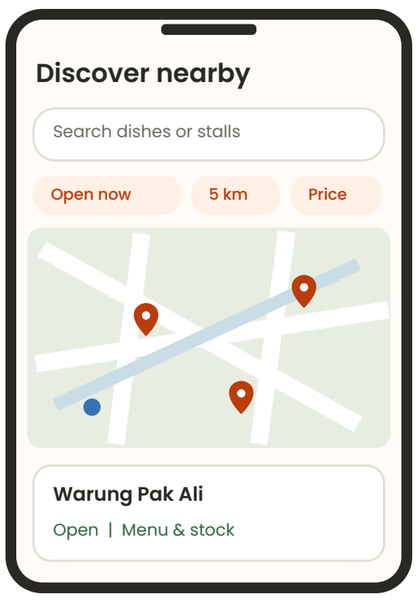

Stall profile, weekly hours, temporary closures, location sharing, menus and stock status.

CUSTOMER CONNECTION

Stall and dish following, notifications, reviews, directions and self-collect bookings.

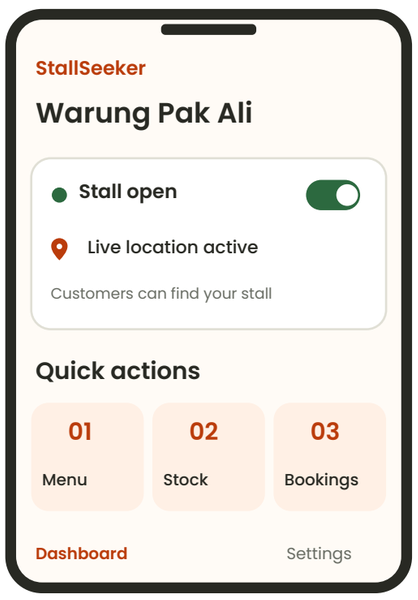

04 Project Design

05 Results / Findings

DOCUMENTED AUTOMATED CHECKS

7/7	5/5	8/8
Flutter tests	Firebase rules	Backend tests

Recorded on 18 Sep 2026. Backend: 3 scheduled-closure + 5 notification-history tests. Android debug build passed; device journeys still require validation.

06 Conclusion

StallSeeker brings stall discovery, vendor updates and customer following into one mobile application. The implemented features support more informed visits to local food stalls.

Next steps: Complete device and usability evaluation. Self-collect payment is currently a test-mode demonstration.
