

STALLSEEKER

Competitive Identity and Product Strategy

Competitive positioning, FYP product focus, commercial direction and success measures

"The live operating map for local and mobile food stalls."

1. Recommended identity

StallSeeker should not become another food-delivery application or a smaller Google Maps.

Its identity should be:

A live discovery platform for finding roadside, small, and mobile food stalls at their current selling location.

The central customer question should be:

"Where is this stall right now, is it open, and what food is still available?"

Competitor roles:

- Google Maps: Where is a place, and how do I reach it?
- GrabFood: What can I order and have delivered?
- foodpanda: What food or groceries can I order and track?
- ShopeeFood: What can I order using Shopee's delivery, payment and voucher ecosystem?
- StallSeeker: Which local or mobile stall is operating near me right now?

This positioning gives StallSeeker a clear identity without competing directly in ordering, payments or rider logistics.

2. Platform-positioning comparison

Platform	Primary purpose	Main unit shown	Main customer action	Main merchant type
Google Maps	General place discovery and navigation	Place or business	Search, inspect and navigate	Almost any physical business
GrabFood	Food ordering and delivery	Delivery-enabled restaurant/outlet	Order, pay and track	Restaurants and delivery merchants
foodpanda	Food, grocery and shop delivery	Vendor/store	Order, pay and track	Restaurants, shops and pandamart
ShopeeFood	Food delivery within Shopee ecosystem	Food merchant	Order, apply vouchers and track	Approved ShopeeFood merchants
StallSeeker	Live local-stall discovery	Current vendor/stall location	Find, follow and physically visit	Roadside, small and mobile food stalls

Google Maps offers broad place discovery, place details, directions, saved places and public contributions. [Google Maps feature overview](#)

GrabFood officially offers delivery, scheduled delivery, self-pickup, payments, rewards and real-time tracking. [GrabFood Malaysia](#)

foodpanda offers delivery, pickup, standard/saver/priority/scheduled delivery, group orders, groceries, tracking, payments, vouchers and pandapro. [foodpanda terms](#), [pandapro](#)

ShopeeFood offers food and merchant search, cart and checkout, delivery tracking, rider communication, scheduled ordering, self-pickup, group orders, vouchers and payments. [ShopeeFood ordering](#), [scheduled orders](#), [group orders](#)

3. Complete customer-feature comparison

Legend:

- Yes Strong/core feature
- Partial Available in a limited or different form
- No Not available
- Unique StallSeeker differentiator

Discovery and maps

Feature	Google Maps	GrabFood	foodpanda	ShopeeFood	Current StallSeeker
General interactive map	Yes	Partial delivery context	Partial delivery context	Partial delivery context	Yes
Current GPS location	Yes	Yes	Yes	Yes	Yes

Avoid claiming that small vendors categorically cannot join delivery platforms. ShopeeFood officially says home-based sellers may apply, and all major platforms have merchant onboarding and verification processes. [ShopeeFood merchant application](#), [Grab merchant application](#)

The stronger argument is not "small vendors cannot join." It is:

Delivery platforms are transaction and delivery systems centred on registered outlets and fulfilment. StallSeeker is a lightweight discovery system centred on vendors whose selling location or availability may change.

5. Competitor strengths and gaps

Google Maps

Strengths:

- Best general map and navigation experience.

- Enormous place database.
- Strong search and nearby discovery.
- Directions, traffic, Street View and map layers.
- Saved places, lists, reviews and public contributions.
- Free Business Profiles.

Gaps StallSeeker can address:

- Not designed around temporary or mobile selling positions.
- No dedicated "vendor started selling here now" workflow.
- No customer-facing low-stock or sold-out timestamp.
- No dedicated followed-stall opening history.
- Registered information can represent a fixed place rather than today's selling spot.

GrabFood

Strengths:

- Strong delivery ecosystem.
- Large customer and merchant network.
- Search by restaurant and dish.
- Instant and scheduled delivery.
- Self-pickup and Dine Out.
- Payments, rewards, subscriptions and promotions.
- Rider tracking and communication.
- Group orders.

Gaps StallSeeker can address:

- Discovery is centred on merchants available for a transaction.
- A merchant is generally treated as a registered outlet.
- Not designed primarily for finding a moving roadside stall and visiting it physically.
- Transaction, delivery and promotion interfaces can be excessive for someone who only wants to locate a stall.

foodpanda

Strengths:

- Food and grocery delivery.
- Multiple delivery modes.

- Scheduled delivery and pickup.
- Group orders.
- Real-time order tracking and rider communication.
- Vouchers, deals and pandapro.
- Large restaurant, shop and pandamart selection.

Gaps StallSeeker can address:

- Location exists mainly to determine delivery coverage.
- The platform prioritises purchasing and fulfilment.
- No dedicated workflow for following a mobile vendor's current selling position.
- No live low-stock state intended for physical walk-in customers.

ShopeeFood

Strengths:

- Strong voucher and ShopeePay ecosystem.
- Search by food or merchant.
- Scheduled delivery.
- Self-pickup.
- Group ordering and bill-splitting support.
- Rider tracking, chat and calling.
- Order ratings and tips.
- Integration with the wider Shopee platform.

Gaps StallSeeker can address:

- Strong emphasis on deals, checkout and delivery.
- Requires merchant and transaction workflows that are unnecessary for simple discovery.
- Not focused on changing roadside vendor locations.
- No specialised "follow stall and notify me when it opens nearby" identity.

6. StallSeeker's five identity pillars

Pillar 1: Live Stall Map

The map should answer:

- Which stalls are operating?
- Where are they selling now?
- When was that location last updated?
- How far away are they?
- Is the displayed location trustworthy enough to visit?

This is the primary differentiator.

Pillar 2: Mobile and Local Vendor Discovery

Prioritise:

- Roadside stalls.
- Mobile food vendors.
- Night-market traders.
- Small independent vendors.
- Home-based vendors with pickup points.
- Vendors whose selling locations change by day or time.

Permanent restaurants can appear, but they should not define the brand.

Pillar 3: Visit, Not Delivery

The main call to action should be:

- Find stall.
- View today's location.
- Check menu and stock.
- Get directions.
- Call vendor.
- Follow for future openings.

It should not be:

- Add to cart.
- Checkout.
- Pay.
- Track rider.

Pillar 4: Freshness and Reliability

Every important vendor state should show freshness:

- Location last updated.
- Open status last confirmed.
- Menu stock last updated.
- Schedule last changed.
- Temporary closure.

A stale location should never look equivalent to a recently confirmed location.

Pillar 5: Guest-First Discovery

Customers should be able to:

- Open the app.
- See nearby stalls.
- Search.
- View menus.
- Check stock.
- Get directions.

Login should only be required for:

- Following stalls.
 - Receiving notifications.
 - Writing reviews.
 - Managing personal account data.
-

7. What StallSeeker should focus on for the FYP

Essential FYP identity features

- Live or recently updated vendor location.
- Clear recent-location versus last-known-location state.
- Open/closed vendor-controlled status.
- Nearby map and result list.
- Stall-name and category search.
- Global dish search across every stall.
- Distance and nearest-first results.
- Search this area.
- Future opening-time search.
- Menu and stock status.
- Follow vendor.
- Opening notification.
- Notification history.
- Guest browsing.
- Directions handed to Google Maps.
- Strong comparison and limitation documentation.

Features that demonstrate the identity best

The presentation should demonstrate this story:

1. A vendor moves to a selling location.
2. The vendor opens the stall and shares the location.
3. The vendor marks one dish low stock and another sold out.
4. A guest searches nearby stalls without logging in.
5. A customer searches for a dish and sees matching nearby vendors.
6. The customer checks location freshness and stock.
7. The customer opens directions in Google Maps.
8. A signed-in customer follows the vendor.
9. The vendor opens on another day or location.
10. The customer receives an opening notification.

That sequence demonstrates something Google Maps and delivery apps do not provide as one workflow.

Do not add to the FYP

- Ordering.
- Shopping cart.
- Payment gateway.
- Delivery fees.
- Rider registration.
- Rider assignment.
- Rider tracking.
- Group orders.
- Grocery ordering.
- Subscription plans.
- Complex voucher systems.
- Internal turn-by-turn navigation.
- Traffic, Street View or satellite functionality.

These would increase scope while weakening the project's identity.

8. What StallSeeker should have commercially

After the focused FYP is stable, a commercial version could add:

Trust and verification

- Verified-vendor badge.
- Identity and contact verification.
- Optional local-authority or licence verification.
- Clearly labelled halal certification only when officially verified.
- Community report for "vendor not here," "closed," or incorrect information.
- Moderation process.
- Vendor reliability score based on accurate status/location updates.

Discovery quality

- Global dish search.
- Search suggestions and history.
- Exact "updated X minutes ago" information.
- Automatic map framing.
- Marker clustering.
- Saved locations.
- Shareable stall profiles.
- Food trails or curated local-stall lists.
- Language support for English and Bahasa Malaysia.
- Low-data mode.

Vendor value

- Profile-completeness guidance.
- View count.
- Search appearance count.
- Direction-tap count.
- Follow count.
- Notification engagement.
- Most-searched dishes.
- Peak customer-interest times.
- QR code linking directly to the stall profile.
- Simple daily reminder to confirm location, opening and stock.
- Ability to reuse common selling locations.

Customer retention

- Followed stalls.
- Opening and relocation alerts.
- Optional nearby alert when a followed vendor opens.
- Saved stalls and custom lists.
- Search history.
- New-menu-item notifications.
- Notification frequency controls.

Partnerships

- Universities and campuses.
 - Night-market organisers.
 - Municipal councils.
 - Tourism boards.
 - Food festivals.
 - Local entrepreneur programmes.
 - Hawker and small-trader associations.
-

9. Recommended business model

StallSeeker should avoid depending on order commission because it is not an ordering platform.

Recommended model:

Free vendor tier

- Public stall profile.
- Current location.
- Opening status.
- Basic menu.
- Basic schedule.
- Customer following.

Optional paid vendor tier

- Verified badge after proper checks.
- Advanced analytics.
- More photographs.
- Promotional announcements.
- Multiple recurring selling locations.
- Enhanced profile customisation.
- Clearly labelled sponsored visibility.

Institutional revenue

- Event or night-market maps.
- Tourism discovery campaigns.
- Council or campus vendor directories.
- Aggregated, privacy-safe market insights.
- Sponsored local-food trails.

Rules:

- Never hide essential location information behind payment.
 - Never allow payment to fake popularity or trust.
 - Label sponsored results.
 - Keep organic search based primarily on relevance, distance, freshness and availability.
 - Do not charge customers merely to discover vendors.
-

10. Go-to-market strategy

Do not launch everywhere with insufficient vendor density.

Start with one concentrated area:

- One university campus.
- One night market.
- One tourist district.
- One municipality.
- One food festival.

Recommended pilot:

- Recruit 20–30 active vendors in one area.
- Ensure every vendor has a complete profile, image, schedule, menu and location.
- Train vendors to update open status and stock.
- Give each vendor a QR code.
- Test whether customers can reliably find them.
- Measure repeated usage before expanding geographically.

A map with three reliable, active vendors is more useful than a national map containing hundreds of stale profiles.

11. Key success measurements

FYP measurements

- Time required to find a nearby stall.
- Accuracy of displayed vendor location.
- Percentage of users completing discovery without assistance.
- Success rate of global dish search.
- Percentage of users who understand that StallSeeker is not a delivery app.
- Guest versus registered-user task completion.
- Follow and notification success.
- Usability score.
- Vendor satisfaction with location and stock updates.

Commercial measurements

- Active vendors per geographic area.
- Percentage of vendor locations updated recently.
- Percentage of vendors confirming open status.
- Monthly active customers.
- Search-to-profile-view rate.
- Profile-to-directions rate.
- Follow rate.
- Notification open rate.
- Repeat visits.
- Vendor retention.
- Reported incorrect-location rate.
- Percentage of complete vendor profiles.

The most important metric should be:

How often does a customer successfully locate and visit a stall using current information?

Not order volume.

12. Main product risks

Risk	Required response
Too few vendors	Launch area by area and prioritise density
Stale vendor location	Display freshness prominently and expire unconfirmed status
Vendor forgets to close	Automatic expiry or confirmation reminders
Vendor forgets stock updates	Make updates fast and show timestamps
False or duplicate vendors	Verification and reporting
Inaccurate claims about certification	Show certification only after verification
Notification spam	Follow-based alerts and frequency controls
Privacy concerns	Share business-selling location only while intentionally operating
Unsafe roadside location	Allow reporting and basic safety guidance
Weak differentiation	Keep all messaging centred on current mobile-stall discovery
Comparison with delivery apps	State clearly that there is no ordering, payment, delivery or rider
Comparison with Google Maps	Emphasise dynamic vendor location, freshness, stock and opening alerts

13. Recommended positioning language

One-sentence description

StallSeeker helps customers discover roadside and mobile food stalls using their latest selling location, operating status and menu availability.

Short pitch

Unlike Google Maps, which focuses on general places, and delivery apps, which focus on ordering and riders, StallSeeker helps people physically find local food vendors whose location and availability may change.

Customer promise

Find the stall you want before it moves or sells out.

Vendor promise

Tell nearby customers where you are selling today.

Possible taglines

- Find local stalls, live.
- Know where they're selling today.
- Find it before it's gone.
- Local food, current location.
- Your favourite stall, wherever it goes.

14. Final strategic direction

StallSeeker should own the space between Google Maps and food-delivery platforms:

Google Maps StallSeeker Delivery apps
General place discovery Live stall discovery Food transactions
Fixed business locations Current selling location Registered outlets
Directions Visit preparation Delivery fulfilment
Broad business data Live menu/stock status Cart and payment
Saved places Follow mobile vendors Track riders

The defensible identity is not "a cheaper GrabFood" or "Google Maps for food."

It is:

The live operating map for local and mobile food stalls.

Every major feature, report objective, demonstration and marketing statement should reinforce that identity. Features that do not improve live stall discovery, location reliability, menu availability, physical visits or vendor visibility should remain outside the core FYP scope.
