

FYP Meeting Notes

StallSeeker - Complete point-form summary

Meeting date	23 September 2026
Recording length	Approximately 39 minutes
Main focus	Project scope, objectives, comparisons, guest access, map experience and verifier preparation
Project status	Approximately 70-80% complete

Core message	StallSeeker is a specialised application for discovering and locating registered roadside or mobile food stalls. It is not a food-ordering, payment, delivery or rider-tracking platform.
--------------	---

Highest-priority task	Prepare factual comparison tables for food-delivery platforms and Google Maps, then use them to clarify the scope and Objective 2 with the supervisor and verifier.
-----------------------	---

1. Project identity and scope

- StallSeeker is designed to help users discover and locate food stalls.
- The core customer functions are:
 - Find nearby stalls.
 - View stall locations on a map.
 - Search for a particular stall or dish.
 - Follow selected vendors.
 - Receive notifications from followed vendors.
- The current project does not include:
 - Food ordering.
 - Online payment.
 - Delivery services.
 - Rider assignment or rider tracking.
- The report and presentation must state these exclusions clearly and early.
- Describe the application as a system specialised for stall searching and location discovery.

2. Target users and vendors

- The primary vendors are small, roadside, temporary or mobile food stalls.
- Some target stalls may not have permanent premises or a stable location.
- Some may not be registered on Google Maps, GrabFood, Foodpanda or ShopeeFood.
- The application can help tourists discover local roadside food, especially in areas with fewer established restaurants.
- Do not rely only on the claim that small vendors cannot afford platform fees; some small traders already use delivery platforms.
- Use stronger evidence to explain why these vendors need StallSeeker.

3. Verifier misunderstanding and communication issue

- The verifier compared StallSeeker with GrabFood, Foodpanda, ShopeeFood and Google Maps.
- The project appeared similar because it uses a map and displays food vendors.
- The team tried to explain the difference, but the intended scope did not come across clearly.
- The absence of an explicit disclaimer and limitations section contributed to the misunderstanding.
- Treat this as a communication problem: respond with facts, comparisons and scope evidence rather than simply stating that the verifier is wrong.

4. Scope disclaimer and limitations

- Add a clear statement near the beginning of the report and presentation:
 - StallSeeker is not an ordering or delivery platform.
 - It does not provide payment, rider assignment or rider tracking.
 - It focuses on discovering and locating registered stalls.
 - Full navigation can be handled externally through Google Maps.
- List all out-of-scope functions so evaluators do not expect GrabFood-like behaviour.

5. Objective 2 issue

- The verifier asked the team to refresh or revise an objective, mainly Objective 2.
- The existing wording appears to involve tracking vendor locations on a map and allowing customers to receive vendor notifications.
- The verifier suggested replacing or revising the vendor-location objective but did not provide clear replacement wording.
- Vendor location tracking is already one of the central project goals, so the team is unsure what should change.

- Before changing anything, compare:
 - The original objective.
 - The current objective.
 - The verifier's exact written comment.
 - Any recommended statement.
 - The team's proposed revision.
- Clarifying the wording may be appropriate, but a complete objective change could require major report and development changes.
- Do not make a major change until the verifier's intended concern is understood.

6. Project progress and assessment risk

- The application was estimated to be approximately 70-80% complete.
- Most core development is done; remaining work involves improvements, supporting features, interface refinement and stronger justification.
- About 30 minutes of the previous verification session were spent discussing the objective.
- Because of that discussion, the verifier did not properly review the admin interface.
- Verifier suggestions are not automatically compulsory, but they matter because the same verifier may be involved in later marking.
- If the project is still misunderstood during final assessment, the marks may be affected.

7. Required comparison tables

- Create a StallSeeker versus food-platform comparison covering:
 - GrabFood, Foodpanda and ShopeeFood.
 - Target vendor type and support for roadside or mobile vendors.
 - Location tracking, stall discovery and dish searching.
 - Ordering, payment, delivery and rider services.
 - Following, notifications, guest access and account requirements.
 - Features intentionally excluded from StallSeeker.
- Create a separate StallSeeker versus Google Maps comparison covering:
 - General place searching versus registered-stall searching.
 - Nearby results, distance, opening hours and directions.
 - Mobile-vendor location updates and dish-focused discovery.
 - Following vendors, vendor notifications and guest access.
 - Saved places, recent searches and search history.
- Do not claim that a competitor lacks a function without checking it.
- Test the established applications personally and base every comparison on evidence.

8. Clear answer to Why not just use Google Maps?

- StallSeeker focuses specifically on participating food stalls.
- Vendors register directly with StallSeeker and may update their current selling location.
- The system can support roadside or mobile stalls that may not be represented properly on general map services.
- Users can follow a particular vendor and receive relevant vendor updates.
- Searches can focus on stalls and dishes instead of general places.
- Google Maps can still be used for final route navigation.

9. Guest access and search history

- Basic discovery and map browsing should be available without mandatory login.
- A guest should be able to:
 - View the map and nearby stalls.

- Search for stalls and dishes.
- View stall details.
- Use Search this area.
- Choose another search location.
- View recent searches or device-based search history.
- Open directions in Google Maps.
- Guest history may be stored locally on the device and will not automatically appear on a different device.
- Research how long guest history should remain, whether it expires and what removes it.
- Do not use search history alone to justify mandatory login because existing applications already provide some history without a dedicated account.
- Demonstrate guest access first during the presentation.

10. Logged-in customer functions

- Login must provide clear additional value beyond guest access.
- Suitable account-specific functions include:
 - Following vendors.
 - Saving or favouriting stalls.
 - Receiving notifications from followed vendors.
 - Viewing notification history.
 - Synchronising saved information across devices.
 - Managing personal preferences.
- Forgot password is an account-support function, not a user privilege or feature justification.
- Clearly explain who needs to log in, why login is required and which features become available afterward.

11. Notification and vendor logic

- Define exactly why a customer receives a notification from a stall.
- A notification should be linked to a deliberate action such as following, favouriting or enabling vendor alerts.
- Do not send the same vendor alert to unrelated users.
- Avoid frequent or irrelevant notifications and give users control over them.
- Because the current system does not support ordering or payment, do not imply that notifications depend on a purchase.
- Useful notifications may include location changes, opening status, availability, promotions or offers.
- Clarify the vendor role, which may include:
 - Maintaining a stall profile and pictures.
 - Updating the current location and operating status.
 - Setting opening and closing times.
 - Adding dishes.
 - Sending relevant updates to followers.

12. Map, marker and nearby-search experience

- The current blue and red map indicators were confusing.
- Red markers appeared to represent stalls, while the blue indicator appeared related to the selected area or search centre.
- Remove unnecessary indicators or make every marker's meaning immediately clear with consistent design or a legend.
- Search this area should update the markers, result list, stall count and search radius for the visible map region.
- Provide a nearby summary, including the number of stalls, nearest results, radius and distance.
- Implement relevant familiar map behaviours:
 - Near me results.
 - Distances in metres or kilometres.

- A result list that matches the markers.
- Automatic zooming to show matching results.
- Recent searches and clear location indicators.
- Manual location selection and a directions option.
- Users should not need excessive scrolling or repeated clicks to see useful results.

13. Dish search and searching another area

- A search for a dish such as ayam goreng should show every relevant stall, not only one result.
- Each result should show the stall name, image, dish information, distance and matching map marker.
- The map can automatically adjust to show all matching stalls.
- Improve the current images and result layout because they were considered insufficiently user-friendly.
- Allow users to search around a destination other than their current location, which supports travel planning.
- Clearly distinguish the current location, selected search location and selected stall location.

14. Stall details and directions

- When a stall is selected, show:
 - Stall name and image.
 - Available dishes.
 - Distance from the current or selected location.
 - Opening and closing times.
 - Current open or closed status.
 - Vendor-location details.
 - A Get directions option.
- StallSeeker does not need to implement complete turn-by-turn navigation.
- The Get directions action can redirect the user to Google Maps for route calculation, transport options and navigation.
- Show the important stall information before redirecting the user.
- Document external navigation as a project limitation and integration decision.

15. Rider feature and future enhancement

- Rider functionality is not part of the current project scope.
- Adding riders would move the project toward ordering and delivery, which is not the present objective.
- Rider support may be considered only as a future enhancement after all current objectives are completed.
- Do not describe it as a backup plan.

16. Presentation and verifier meeting

- Start the demonstration in guest mode and show basic discovery without requiring an account.
- Introduce login only when demonstrating genuinely personalised functions.
- State the project purpose and exclusions at the beginning of the presentation.
- Use the prepared comparisons when answering questions instead of relying on personal opinions.
- Retrieve the verifier's written comments, including comments recorded in Excel.
- Send the comparison tables to the supervisor and make sure the supervisor understands the intended scope.
- Arrange an appointment with the verifier; one prepared team representative may attend if the full team cannot.
- During the session, clarify the misunderstanding, present the comparisons and ask exactly what must be refreshed in Objective 2.
- Do not change the report until the requested objective revision is clear.

17. Prioritised action checklist

Priority 1 - Clarify the project

- ☐ Retrieve the original and current objective statements.
- ☐ Retrieve the verifier's exact written comments.
- ☐ Draft a clearer Objective 2 without changing the core project direction.
- ☐ Write the scope disclaimer and project limitations.
- ☐ Strengthen the target-vendor justification with evidence.

Priority 2 - Build the evidence

- ☐ Create the food-platform comparison table.
- ☐ Create the Google Maps comparison table.
- ☐ Explore all relevant competitor features personally.
- ☐ Verify guest, history, login, nearby-search and notification behaviour.
- ☐ Define StallSeeker's defensible points of differentiation.

Priority 3 - Improve the application

- ☐ Separate guest and logged-in functions clearly.
- ☐ Add or improve device-based guest search history.
- ☐ Clarify notification rules and vendor functions.
- ☐ Simplify map markers and improve Search this area.
- ☐ Add nearby counts, radius, distance and complete result lists.
- ☐ Improve dish searching, result images and layout.
- ☐ Support searching around a manually selected destination.
- ☐ Display opening hours, open or closed status and key stall details.
- ☐ Add Get directions and redirect navigation to Google Maps.

Priority 4 - Prepare for evaluation

- ☐ Send the completed comparisons to the supervisor.
- ☐ Confirm the objective wording with the supervisor and verifier.
- ☐ Prepare a guest-first demonstration flow.
- ☐ Prepare factual answers to Google Maps and delivery-platform comparisons.
- ☐ Arrange the clarification appointment with supporting materials ready.
- ☐ Update the report only after the objective issue is resolved.

**Recommended
next milestone**

Finish both comparison tables, confirm the intended revision to Objective 2, and then implement only the map, guest-access and information improvements that directly support the clarified scope.
